

## William's Invention

Due to the financial struggles that William's family were facing, his father was no longer able to pay William's school fees. Desperately, William went to his local library every day and translated English textbooks so that he could learn about Science. He taught himself all about circuits and electricity. With an idea in mind, William started to gather things that he thought might be useful, like an old wheel and a headlight from a bike. After many days of hard work and being laughed at by the people in his village, William built his own wind turbine which powered a light bulb for his bedroom. Soon, he was able to develop this to provide electricity for his whole house.
